

QUICK START GUIDE • VERSION

Up & running in 30 minutes.

From first install to posting journal entries in Sage 50 automatically — this guide gets you there.

After setup: **Email PDF → 20 seconds → Journal entries in Sage 50 + summary email**

BEFORE YOU START

- ☐ Python 3.11+
- ☐ Sage 50 (2025+)
- ☐ Google Cloud SDK
- ☐ GCP Project Created
- ☐ Gmail Account Ready

// PART ONE

Initial Setup

Do this once. After setup, the system runs automatically every month.

🕒 Total time: 15 minutes

Authenticate with Google Cloud

~2 min

Sign in to GCP and set your project. This authorizes the system to use BigQuery and Secret Manager.

01

```
gcloud auth application-default login
# → Browser opens → Sign in with your Google account

gcloud config set project vtx-accounting-os-prod
```

✓ Expected: "Credentials saved to ~/.config/gcloud/..."

Enable Third-Party Access in Sage 50

~2 min

The SDK needs explicit permission to connect to Sage 50. This is a one-time setting per user.

02

- Open Sage 50 with the Concetta company file
- Go to **Setup** → **Manage Users**
- Select **sysadmin** → click Modify User
- Under "Rights With Third-Party Products" → select **Read/write access**
- Click OK and save

✓ Setting saved: "Read/write access" selected for sysadmin

Store Credentials in Secret Manager

~3 min

All passwords are stored encrypted in Google Secret Manager. Never enter them in code or config files.

03

```
# Store Sage 50 company file path
echo -n "R:\Concetta Enterprises Inc\2026.SAI" | `
  gcloud secrets versions add vtx-sage50-company-path --data-file=-

# Store Sage 50 password
echo -n "YOUR_SAGE50_PASSWORD" | `
  gcloud secrets versions add vtx-sage50-password --data-file=-
```

✓ Expected: "Created version [1] of the secret [vtx-sage50-company-path]"

Authorize Gmail

~3 min

Grant VTX-OS permission to read and send emails. The OAuth token is stored automatically in Secret Manager.

04

```
cd C:\vtx-os
python scripts/gmail_auth.py
# → Browser opens
# → Sign in as jquinonez2980@gmail.com
# → Click "Allow" on the permissions screen
# → "The authentication flow has completed." → close tab
```

✓ Expected: "Credentials stored in Secret Manager as vtx-gmail-oauth-credentials"

Test the Full Pipeline

~5 min

Close Sage 50 completely first (check Task Manager for Sage.CA.exe), then run the demo.

05

```
cd C:\vtx-os
python demo/monthly_close_demo.py
```

✓ Expected output: [1/6] Indexing engagement letter... OK [2/6] Bookkeeping run... OK [2b/6] Journal entries posted... OK (or SKIPPED if Sage 50 open) [3/6] GL reconciliation... OK [4/6] Preparing HST return... OK [5/6] RAG context query... OK [6/6] Sending close email... OK → Check Gmail inbox for the summary email

// PART TWO

Monthly Usage

After setup, this is all you do each month — 4 steps, under 5 minutes of your time.

WEEK 1-3 Normal Operations Enter transactions in Sage 50 as usual. System is monitoring your inbox automatically. MONTH END · STEP 2 Close Sage 50 + Email PDF Close Sage 50 fully. Email the PDF to jquinonez2980@gmail.com. Wait 20 seconds.	MONTH END · STEP 1 Export Bank Statement Save as PDF with date in filename: dec-2025-bank.pdf MONTH END · STEP 3 Review Results Check inbox for summary. Open Sage 50 General Journal. Review Suspense (59000000) entries.
--	--

The watcher runs continuously in the background. As long as `python scripts/gmail_watcher.py` is running, every new bank statement email triggers the full pipeline automatically.

// PART THREE

Understanding the Output

What every section of the monthly close email means.

From: jquinonez2980@gmail.com To: jquinonez2980@gmail.com Subject: Concetta Enterprises -- 2025-12 Monthly Close Label: vtx-processed	
BANK ACTIVITY — WHAT HAPPENED IN YOUR ACCOUNT	
Deposits	\$23,249.07

Withdrawals	\$9,819.46
Net Movement	+\$13,429.61
Journal entries posted	20 posted · 5 to suspense · 0 errors

→ Your cash position for the month. Journal entries are now in Sage 50's General Journal.

GL RECONCILIATION – HOW WELL BANK MATCHES SAGE 50

Matched	19 of 20 transactions
Unmatched (bank)	1 item – investigate
Unmatched (GL)	2 items – investigate

→ Normal: 1-2 unmatched per month. 5+ items means investigate timing differences.

HST/GST RETURN – ONTARIO 13% (FILE WITH CRA)

Line 101 · Total Revenue	\$45,000.00
Line 103 · HST Collected	\$5,850.00
Line 106 · ITCs Claimed	\$261.21
Line 109 · Net Tax Owing	\$5,588.79 · due 2026-01-31

→ File this amount with CRA by the due date. All figures are pre-calculated.

// After receiving this email – check Sage 50

Open Sage 50 → General Journal → filter December 2025. You'll see 20 new entries. The 5 in Suspense account (59000000) need your reclassification — move them to the correct expense account once you know what they are.

Troubleshooting

Most issues resolve in under 5 minutes with these fixes.

PROBLEM

FAIL_USER_LOGON_FAILED

SDK cannot authenticate to Sage 50

FIX

Enable third-party access

Sage 50 → Setup → Manage Users → sysadmin → Rights With Third-Party Products → Read/write access → OK

PROBLEM

Sage 50 file locked / someone else using it

SDK cannot open SAI file exclusively

FIX

Close Sage 50 completely

Ctrl+Shift+Esc → Task Manager → End Task on: Sage.CA.exe + both "Sage 50 Connection Manager" processes → wait 5 sec

PROBLEM

Email not detected by watcher

Gmail watcher says "Waiting for emails..."

FIX

Check 3 things

1. Is email marked UNREAD? 2. Does filename have date? (dec-2025 or nov-28) 3. Is watcher running? → tail -f logs/watcher.log

PROBLEM

invalid_scope: Bad Request

Gmail OAuth token has wrong permissions

FIX

Delete old token and re-authorize

```
gcloud secrets delete vtx-gmail-oauth-credentials --quiet → python scripts/gmail_auth.py → re-authorize in browser
```

PROBLEM

Journal entries posted = 0

Agent ran but nothing in Sage 50 General Journal

FIX

Sage 50 was open during run

Close Sage 50 completely, re-run with --post-to-sage50 flag. SDK requires exclusive file access to write entries.

PROBLEM

BigQuery tables empty

Agent runs OK but no data in BQ

FIX

Check GCP auth and project

```
gcloud config get-value project → must be vtx-accounting-os-prod → gcloud auth application-default login → retry
```

// PART FIVE

Command Reference

Every command you'll need, copy-paste ready.

System Health Check

Run this daily to verify all systems are working

```
python scripts/health_check.py
```

Gmail Watcher — Production

Runs continuously, processes emails automatically

```
python scripts/gmail_watcher.py
```

Gmail Watcher — Test (dry-run)

Scans inbox but doesn't send emails — safe to test

```
python scripts/gmail_watcher.py --once --dry-run
```

Monthly Close — Full Pipeline

Runs all 6 agents including journal posting to Sage 50

```
python demo/monthly_close_demo.py \  
  --post-to-sage50 \  
  --sage50-sai "R:\Concetta Enterprises Inc\2026.SAI" \  
  --sage50-user sysadmin \  
  --sage50-password "YOUR_PASSWORD"
```

Re-authorize Gmail

Run if you get OAuth errors — re-grants permissions

```
gcloud secrets delete vtx-gmail-oauth-credentials --quiet
python scripts/gmail_auth.py
```

Check BigQuery

Verify data is being stored correctly

```
bq show vtx_accounting
bq query "SELECT COUNT(*) as rows \
FROM vtx_accounting.gl_transactions"
```

// APPENDIX

System Specifications

Average processing time	14-20 seconds per monthly close
Test suite	182/182 tests passing (100%)
Auto-categorization rate	75% (15/20 transactions)
Bank reconciliation rate	95% (19/20 transactions)
Journal entries per close	20 posted • 5 to suspense • 0 errors
Sage 50 SDK version	DB 33002 • Release 2026.1
Account number format	8-digit lId (e.g., 10600000 = Bank)

Suspense account	590000000 – for flagged transactions
GCP project	vtx-accounting-os-prod
BigQuery dataset	vtx_accounting (4 tables)
Gmail scope	gmail.send + gmail.modify
Secrets stored	3 (SAI path, password, Gmail token)

Ready to automate your month-end?

// Email a bank statement PDF to jquinonez2980@gmail.com and watch the system work.

Start: `python scripts/gmail_watcher.py` →

VTX-OS Quick Start Guide · Version 2.0
